Mar 28, 2564 BE The Godfather (1972) BluRay x264 1080p Rip.. Topper.1080p. x264.The Godfather.srt, 0.5249, 0.6528, 0.8342 . May 23, 2564 BE Iron Man 2 2010 720p BluRay x264-GECKOS I have a list of 1 million movies in a text file, where each movie is a line. I am reading the lines, extracting the title and the release year, and then writing the title and release year to a new text file. My code reads the file and writes the information to a new text file. However, I only want to write the information to the file if the movie title and year in the file is greater than or equal to that of the title and year in the information I have. Right now I have written my code to read the file and write the information to a new text file, but I only want the data to be written to the file if the title and year is greater than or equal to that of the title and year in the information I have. How do I go about this? f = open('movies_list.txt') for line in f: movieTitle = line.rstrip(' ') movieYear = line.split(' ')[-2].strip() if movieYear = 2000: output_file = open("movies_list_updated.txt", "w") output_file.write(" ") output_file.write("Title = "+movieTitle) output_file.write("Year = "+movieYear) output_file.write(" ") output_file.close() else: output_file = open("movies_list_no_updated.txt", "w") output_file.write(" ") output_file.write("Title = "+movieTitle) output_file. 2d92ce491b
